

Task 1 – ADR Identification Basics

Patient Information

- Patient: Male, 32 years

Medication History

- Ibuprofen 400 mg – taken twice daily for back pain, started 4 days ago
- Omeprazole 20 mg – taken once daily, used regularly for the past 6 months

Reported Symptoms

- Red, itchy patches on the arms and chest
- Mild swelling around the lips
- Symptoms appeared 2 days after starting ibuprofen

Analysis

The symptoms started 2 days after the patient began taking ibuprofen. The patient did not report any new foods, cosmetics, or other medications during this period. The temporal relationship between ibuprofen administration and the onset of symptoms, along with the absence of other newly introduced potential triggers, suggests that ibuprofen is the most likely suspected drug.

The reported skin symptoms and lip swelling are consistent with a potential hypersensitivity-type reaction.

Conclusion

- Suspected Drug: Ibuprofen
- ADR Identified: Yes
- ADR: Red, itchy skin patches with mild lip swelling
- Type: Type B – Bizarre (hypersensitivity)
- Severity: Mild to Moderate
